# General notes:
#
# This table contains the data the Unicode Consortium has on how
# KOI8-U characters map into Unicode. The underlying document is the
# mapping described in RFC 2319. No statements are made as to whether
# this mapping is the same as the mapping defined as "Code Page 878"
# with some vendors.
#
# Format: Three tab-separated columns
#         Column #1 is the KOI8-U code (in hex as 0xXX)
#         Column #2 is the Unicode (in hex as 0xFFFF)
#         Column #3 the Unicode name (follows a comment sign, '#')
#
# The entries are in KOI8-U order.

# Three tab-separated columns;
# '#' begins a comment which continues to the end of the line.
#   Column #1 is the Mac OS Cyrillic code (in hex as 0xNN)

# The entries are in Mac OS Cyrillic code order.

#
# Notes on Mac OS Cyrillic:
# -----
#
# This is the "Euro sign" version of Mac Cyrillic for Mac OS 9.0 and
# later. Before Mac OS 9.0, there were two separate Slavic Cyrillic
# encodings:
#
# 1. The Cyrillic currency sign variant (used for localized Russian
#    and Bulgarian systems), which had the following:
#       0xA2  U+00A2 CENT SIGN
#       0xB6  U+2202 PARTIAL DIFFERENTIAL
#       0xFF  U+00A4 CURRENCY SIGN
#
# 2. The Ukrainian currency sign variant (used for localized Ukrainian
#    systems and the pre-9.0 Cyrillic Language Kit), which had the
#    following:
#       0xA2  U+0490 CYRILLIC CAPITAL LETTER GHE WITH UPTURN
#       0xB6  U+0491 CYRILLIC SMALL LETTER GHE WITH UPTURN
#       0xFF  U+00A4 CURRENCY SIGN
#
# This new Cyrillic Euro sign version is based on the old Ukrainian
# currency sign variant, with 0xFF changed to be EURO SIGN.
#
# The Mac OS Cyrillic encoding includes the Cyrillic letter repertoire
# of ISO 8859-5 (although not at the same code points). This covers
# most of the Slavic languages written in Cyrillic script.
#
# The Mac OS Cyrillic encoding also includes a number of characters
# needed for the Mac OS user interface and localization (e.g.
# ellipsis, bullet, copyright sign). All of the characters in Mac OS
# Cyrillic that are also in the Mac OS Roman encoding are at the
# same code point in both; this improves application compatibility.
#
# Note: There is a common Ukrainian glyph variation in which the glyph
# for CYRILLIC CAPITAL LETTER BYELORUSSIAN-UKRAINIAN I may or may not
# have a dot above.
#
# Unicode mapping issues and notes:
# -----
#
# Details of mapping changes in each version:
# -----
#
# Changes from version n05 to version b02:
#
# - Encoding changed for Mac OS 9.0 to merge with Mac OS Ukrainian and
#   support EURO SIGN. 0xA2 changed from U+00A2 to U+0490; 0xB6 changed
#   from U+2202 to U+0491; 0xFF changed from U+00A4 to U+20AC.

#
# Notes on Mac OS Roman:
# -----
#
# This character set is used for at least the following Mac OS
# localizations: U.S., British, Canadian French, French, Swiss
# French, German, Swiss German, Italian, Swiss Italian, Dutch,
# Swedish, Norwegian, Danish, Finnish, Spanish, Catalan,
# Portuguese, Brazilian, and the default International system.
#
# Variants of Mac OS Roman are used for Croatian, Icelandic,
# Turkish, Romanian, and other encodings. Separate mapping tables
# are available for these encodings.
#
# Before Mac OS 8.5, code point 0xDB was CURRENCY SIGN, and was
# mapped to U+00A4. In Mac OS 8.5 and later versions, code point
# 0xDB is changed to EURO SIGN and maps to U+20AC; the standard
# Apple fonts are updated for Mac OS 8.5 to reflect this. There is
# a "currency sign" variant of the Mac OS Roman encoding that still
# maps 0xDB to U+00A4; this can be used for older fonts.
#
# Before Mac OS 8.5, the ROM bitmap versions of the fonts Chicago,
# New York, Geneva, and Monaco did not implement the full Mac OS
# Roman character set; they only supported character codes up to
# 0xD8. The TrueType versions of these fonts have always implemented
# the full character set, as with the bitmap and TrueType versions
# of the other standard Roman fonts.
#
# In all Mac OS encodings, fonts such as Chicago which are used
# as "system" fonts (for menus, dialogs, etc.) have four glyphs
# at code points 0x11-0x14 for transient use by the Menu Manager.
# These glyphs are not intended as characters for use in normal
# text, and the associated code points are not generally
# interpreted as associated with these glyphs; they are usually
# interpreted (if at all) as the control codes DC1-DC4.
#
# Unicode mapping issues and notes:
# -----
#
# The following corporate zone Unicode character is used in this
# mapping:
#
# 0xF8FF Apple logo
#
# NOTE: The graphic image associated with the Apple logo character
# is not authorized for use without permission of Apple, and
# unauthorized use might constitute trademark infringement.
#
# Details of mapping changes in each version:
# -----
#
# Changes from version n08 to version b02:
#
# - Encoding changed for Mac OS 8.5; change mapping of 0xDB from
# CURRENCY SIGN (U+00A4) to EURO SIGN (U+20AC).
#
# Changes from version n03 to version n04:
#
# - Change mapping of 0xBD from U+2126 to its canonical
# decomposition, U+03A9.

# U+F8A0.
#
# Before Mac OS 8.5, the ROM bitmap versions of the fonts Chicago,
# New York, Geneva, and Monaco did not implement the full Mac OS
# Roman character set; they only supported character codes up to
# 0xD8. The TrueType versions of these fonts have always implemented
# the full character set, as with the bitmap and TrueType versions
# of the other standard Roman fonts.
#
# In all Mac OS encodings, fonts such as Chicago which are used
# as "system" fonts (for menus, dialogs, etc.) have four glyphs
# at code points 0x11-0x14 for transient use by the Menu Manager.
# These glyphs are not intended as characters for use in normal
# text, and the associated code points are not generally
# interpreted as associated with these glyphs; they are usually
# interpreted (if at all) as the control codes DC1-DC4.
#
# Unicode mapping issues and notes:
# -----
#
# The following corporate zone Unicode character is used in this
# mapping:
#
# 0xF8FF Apple logo
#
# NOTE: The graphic image associated with the Apple logo character
# is not authorized for use without permission of Apple, and
# unauthorized use might constitute trademark infringement.
#
# Details of mapping changes in each version:
# -----
#
# Changes from version n08 to version b02:
#
# - Encoding changed for Mac OS 8.5; change mapping of 0xDB from
# CURRENCY SIGN (U+00A4) to EURO SIGN (U+20AC).
#

```

```
# Changes from version n03 to version n04:
#
# - Change mapping of 0xBD from U+2126 to its canonical
#   decomposition, U+03A9.

#      Unicode version: 4.0
#      Table version:  3.0
#      Table format:   Format A
#      Date:          2003-Nov-12 (header updated: 2015 December 02)
#      Authors:       Ken Whistler <ken@unicode.org>
#
#      General notes:
#
#      This table contains the data the Unicode Consortium has on how
#      ISO 8859-7:2003 characters map into Unicode.
#
#      ISO 8859-7:1987 is equivalent to ISO-IR-126, EL0T 928,
#      and ECMA 118. ISO 8859-7:2003 adds two currency signs
#      and one other character not in the earlier standard.
#
#      Format: Three tab-separated columns
#              Column #1 is the ISO 8859-7 code (in hex as 0xXX)
```

```

#           Column #2 is the Unicode (in hex as 0xFFFF)
#           Column #3 the Unicode name (follows a comment sign, '#')
#
# The entries are in ISO 8859-7 order.
#

#
# 2.0 version updates 1.0 version by adding mappings for the
